

Some early ideas were to simply purchase a vending machine, and restock it ourselves. We once had the idea to actually build our own, but it didn't seem plausible. We explored about 3 different variations, with one of those being right alongside our current project, as we were comparing which of the two was the best decision. Over time, investing in a vending machine had the most logic behind it. Tied into this, some of our previous ideas were simply either too expensive, too time-consuming, or just downright impossible. They were just not what we were looking for in this project. As we gained a new avenue to implement vending machines into DCI, we secured a good deal between us and our stakeholders for an easier situation for Administration to handle financially. However, because of this deal, the school definitely lost the ability to take in the full revenue produced by the machines to fund themselves. Overall, this was the superior choice because there were concerns that DCI would not be able to reallocate extra funds for a machine and restock it on top of that. My team believes that all of DCI will be satisfied with the new addition to the school culture.
