Element D: Design Concept Generation, Analysis, and Selection

Design Idea #1

Date: 2/23

Description:

This design is a two story shelter for the Piedmont wildlife center. The base and ramp will be made out of bamboo, so is the pull out box for food and water. There is an entrance at the bottom for entering the shelter and an entrance at the top for entering the pull out box for food and water. There is a tunnel that goes from the bottom floor to the top floor, and the tunnel will be made out of anti-pill polar fleece. The rest of the open place will be covered with chicken wire so it will be see through. Each piece (top piece side piece etc) will be able to be disassembled and assembled back.

Drawing that includes distinguishing information such as scale, dimensions, and materials:

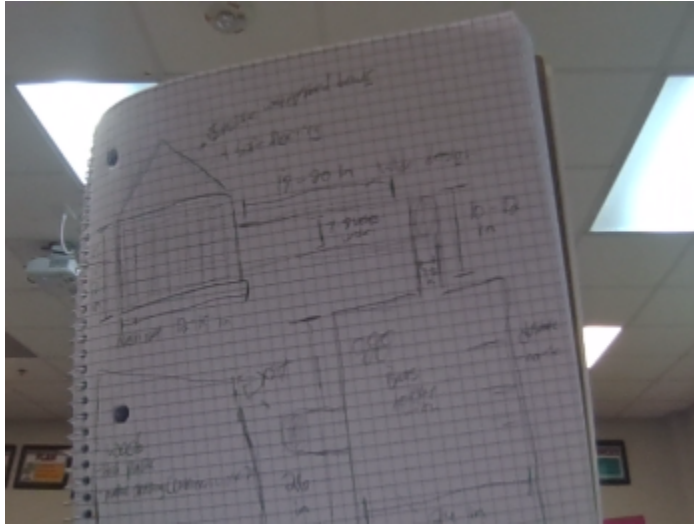

The materials are chicken wire, bamboo and anti-pill polar fleece

The tunnel will be made out of the anti-pill polar fleece

The chicken wire will be for the open space to be covered

The bamboo will be for the base and ramp

Design Idea #2

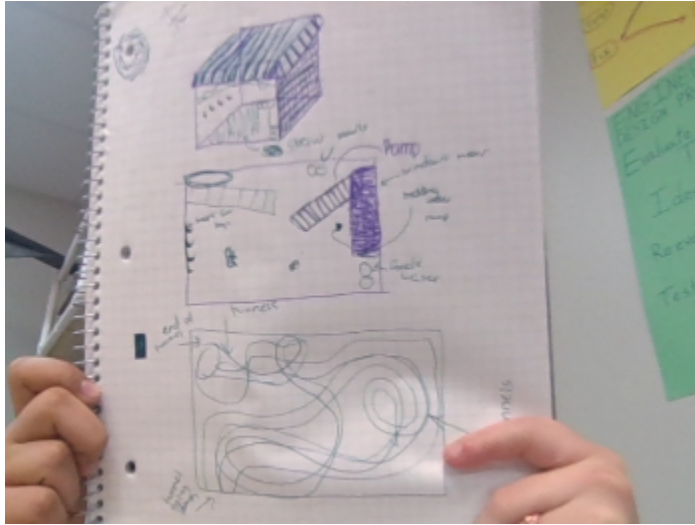

Date: 2/26

Description: This design starts with a small shed-like structure that has a roof, and instead of solid walls it has chicken wire, a spot for the rabbits to feel some fresh air. The flooring in this room is wood chips and there are two metal bowls for the purposes of eating and drinking. Then, there is a hard plastic tunnel connecting to a larger room for playing. Playing and exercise is crucial to a rabbits lively hood, so therefore I designed a proper play area for the rabbits. This room will contain a small obstacle course and some balls. My idea with this is that the rabbits can play with the balls and the obstacle course can not only be used for exercise in itself, but also be used for chase games and/or hide and seek, because according to my prior research, these games are enjoyable and healthy for rabbits.

Drawing that includes distinguishing information such as scale, dimensions, and materials:

- The smaller house is 15in tall and 12x12 w+l.
- The tunnel is 18 in long, 8 inches wide and 8 in tall.
- The bigger house is 24in wide, 26 in long and 18in tall.
- Materials: Wood, hard plastic, chicken wire, wood chips

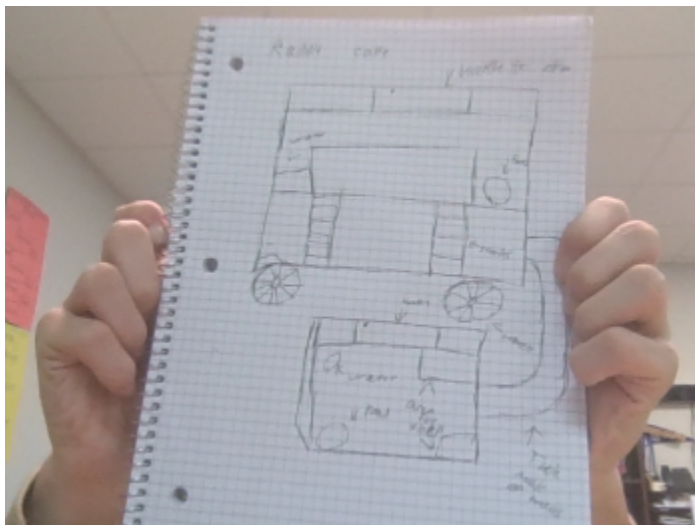

Design Idea #3

Date: 2/26

Description: This design is shaped like a cube and has two stories. It is built out of chicken wire so they can be watched frequently and the rabbits cannot chew it. In the bottom level there is a ramp leading to a platform where a window will be, under it is their bedding. There are hooks on the walls for toys and there's a lot of space for roaming. There is another ramp that leads to a second floor that is only tunnels, there are two and they connect but one is smaller and one is bigger if they need to separate.

Design Idea #4

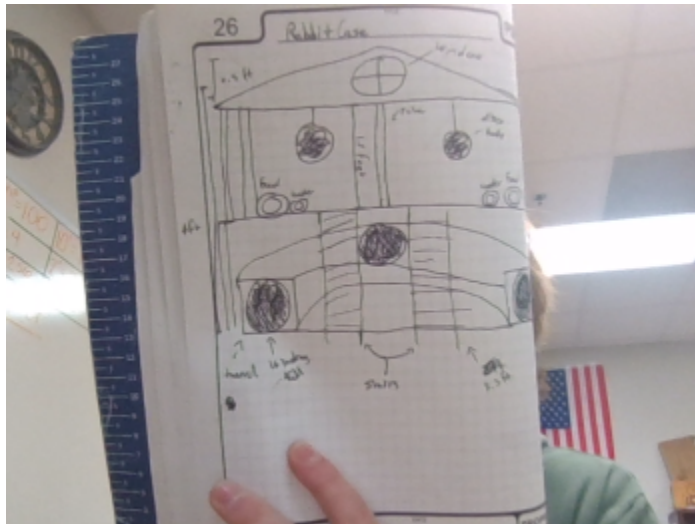

Date: 3/2/26

Description: The drawing is a cage with a tube that allows the rabbits to be in a room by themselves with food and water available and a hatch in both the main and small area of the cage to allow for the trainer to get the rabbit anytime. The tube and the cage can be removed so the people can switch the design of the cage and give the rabbits a way to explore a new area if they want. In the main cage there are two levels: an upper and a lower; the upper has food and water while the lower has more space which allows for there to be toys for the rabbits and for them to walk or run around. The cage has wheels so it's easier to be moved instead of having it carried around, you can just move it. The material is made of untreated kiln dried pine which is the best wood for the rabbits, the scale is going to be 25 inches long and 20 inches wide while the smaller cage attached is 20 inches long and 15 inches wide.

Drawing that includes distinguishing information such as scale, dimensions, and materials:

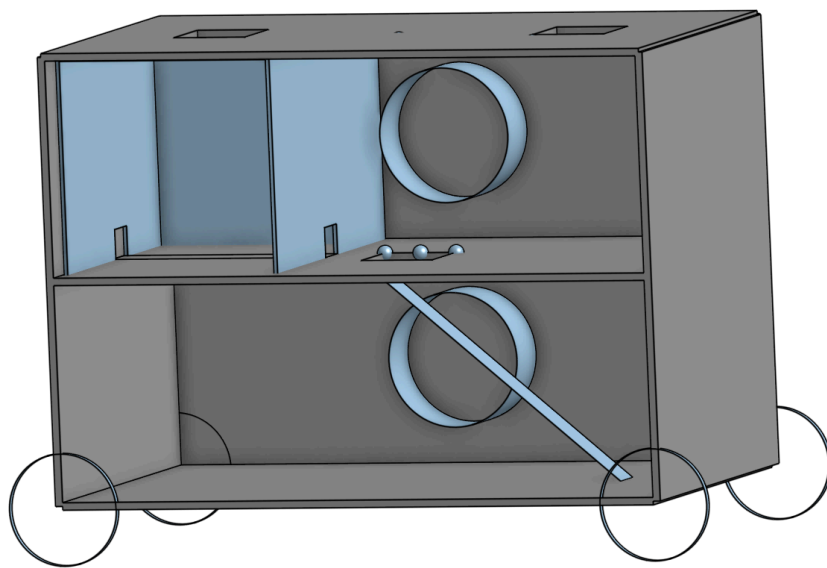

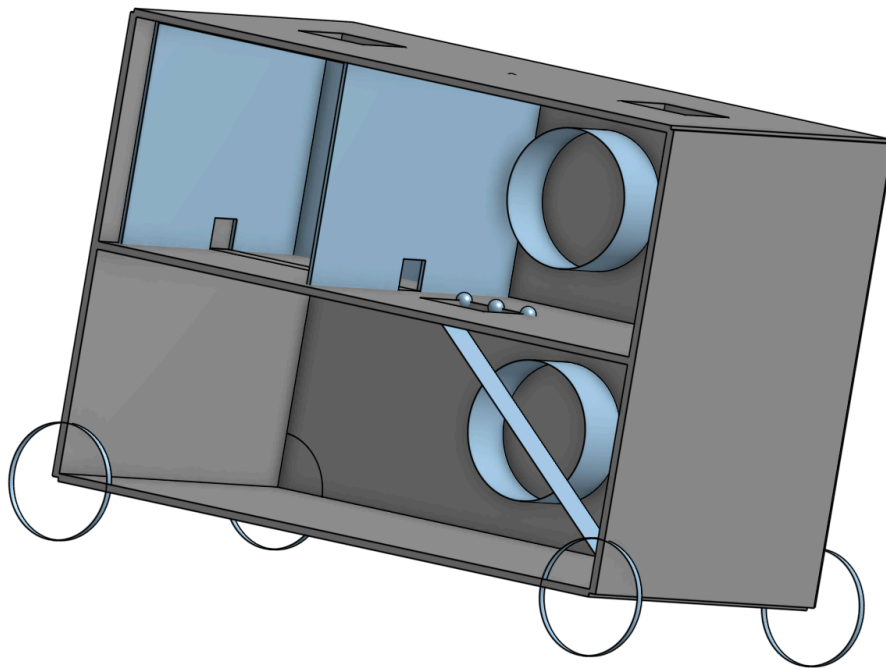

Design Idea #5

Date: 2/26

Description: This starts with a hollow bottom with tunnels that have 3 different exits for the rabbits to crawl up and have fun. There are two sets of stairs made of chicken wire that travel up the bottom base. The supporting poles on top and the bottom are made of bamboo. Up in the top layer is a spacious lounge that the rabbits can have fun with little disco balls and they can eat. All areas in this rabbit closure are open so the owner can grab them up anytime. They can play around and have fun while being safe because they always know where they are.

Design Blueprint #1

Date: 3-11-26

Supply List and Costs:

Item	Cost each	# needed	Total
Chicken wire	~5 dollars	30 inches	depends
Bamboo	Free	Enough for the base and ramp	free
anti-pill polar fleece	~6 dollars per yard	30 inches	~18
Total Cost			~30

Explanation

The blueprint that was created is design idea one but we as a team decided to add some more material to it. The top of the base has two openings. The openings are for the staffs to easily grab the rabbits. The opening on the second floor is for the ramp that goes from the bottom floor to the second floor. The blue box is the pull-out-box for food and water, it has an opening on the side for the rabbits to enter or exit from. There are some little tiny balls for the rabbits to play with on the ceiling and near the opening for the ramp. The open space will be covered with chicken wire and the base will be made out of bamboo. The bamboo is good for the rabbits to chew on because it is not toxic and rabbits love to chew on stuff. We added some wheels so that the shelter will be easily moved around the facility. This shelter will be easily cleaned out and the rabbits will be able to chew on. There will also be an opening at the bottom of the chicken wire for the rabbits to enter and exit from. The circles on the wall of the base are for the rabbits to sit and chill in because they like to be sitting around. We will cover those circles with chicken wire and keep it like a flap for the rabbits to enter and exit from and for the staff to reach in and grab the rabbit.
