

D1:

Blue – Kerry
 Green – Kobe
 Red – Seth

Expansion on blue design 1 and 2: For the first concept that was drawn up I wanted to think about any possible ramp/platform expansions with the whole tank in mind, I'd imagine that if we were to continue using the 18x12 placeholder size for the basking platform then I'd probably want the ramp to not only be that same size but probably extend a little farther into the tank to ensure that it's barely steep. To ensure the ramps accessibility I'd want small "bumps" (i don't know how to explain this in any better way) on the ramp to make sure that the smaller turtle with less claws can get up the ramp. The size of the ramp also leaves room for both turtles to go up at once. By the third round we had thought up an idea where we could maybe improve the filtration of the tank as the primary stakeholders had previously commented on that.

For the second concept I had thought up an idea where we'd connect a small transparent box/cage for the turtles on the basking platform. This would allow the turtles to be moved out of the tank easier without having any given caretaker get bit while trying to handle the turtles. The size of the box/cage depends on how big we make the basking platform, bare minimum we'd have to have it

be big enough to house both turtles comfortably so maybe around a 10x12 area would be a good hypothetical starting point. As for the container itself the door for where the turtle could enter should only be openable from the outside, have holes for ventilation, and a opening on the top to allow for easy feeding and cleaning of either of turtles' shells.

Expansion on red design 1 and 2: For the first concept that was drawn up by Seth it was a remodeling of the basking platform and the ramp, including a new bigger platform with the baseline size of 18x12 for the platform, the ramp would be the same size as the platform. Seth also included a part where support for the platform would be in the actual design. By the third design Kobe had drawn up an idea where we would make the ramp steeper to allow for the turtles to get more exercise while still keeping the rest of the ramp design.

For the second concept Seth created it focused more on the ramp as the basking platform idea was already pretty good. The new ramp would have a pivot that could move the ramp either up or down depending on the turtles need. This could allow for easier accessibility for both turtles without needing to have the ramp expand deeply into the tank which would make the tank less cluttered and give the turtles more space.

Expansion on green design 1 and 2: Kobes first design was focused more on the basking platform where it would of course be expanded to a 18x12 size but now it'd have the uv light angled over the platform instead of directly on it. The main addition was a new feeder that would be attached to the basking platform and automatically feed the turtles to serve as positive reinforcement for basking. The feeder would be rather big and instead connected to the side of the tank instead of the actual basking platform to reduce the weight on the platform and allow for easier care of the feeder by having it easily detachable. By the third design of his platform we had moved the uv light to be above the basking platform for maximum coverage, the feeder should have 2 dispensers of varying size to ensure the turtles don't steal each other's food as Attia had previously mentioned that the bigger one of the two is a glutton.

D2: When comparing all our designs to the requirements we had previously set up the first design that doesn't adhere to our criteria is Kobe's as the feeding mechanism would disrupt their acquisition of food and how they do it which would hurt them; as previously mentioned by one of the primary stakeholders, the turtles enjoy it when they have to "chase" their food in the tank to get it and this design completely removes this aspect of their enrichment. This wouldn't necessarily help the efficiency of their care either as the primary stakeholders would most likely prefer feeding the turtles themselves to begin with. Seth's design of improving the basking platform size and ramp are good only needing the exact sizes and dimensions for how it would hypothetically be done. Kerry's of a carrying container for easy turtle transport hinges on whatever basking platform the tank will have by the end of the project, this means that the potential weight and size of the container could vary over time as the platform changes. This in turn would make Seths idea,

currently, the most feasible and fleshed out as it doesn't hinge on a prerequisite or factors we don't have knowledge/control over.

We've decided on my solution of an attachable basking platform for easy removal and transportation of the turtles while still achieving the requested goal of a bigger overall basking platform. For the ramp portion of the platform we'll be using Seths idea of a slight pivot on the ramp along with bigger bumps(?) to make it easier for the turtles to climb up and to have enough space to have both of them climb up it at the same time if need be.

D3:

D4: For our first prototype we're thinking that the new basking platform should be boxlike and hang off the side of the tank so allow for easy removability and transport of the turtles. The UV could either be inside or outside the platform as we intend for it to be made out of a see through material to be able to see the turtles while they bask. The ramp should be set at a 9 degree angle to ensure its not steep and allow the turtles to go up it easily; alongside that it should also have indents that allow for easier grip for the turtle without claws on one of its fins.
