

# Element A:

## Presentation And Justification Of The Problem

### PROBLEM:

The librarian at Eleanor Roosevelt High School needs to be able to clearly see everywhere in the library from her desk because as the manager of the library, she needs to know what is going on in her library. She wants to make sure that every student is at the right place at the right time for safety reasons. This will benefit the students' education and ensure that no student is skipping their classes. Not only does having access to the whole library allow her to see who comes in and out of the library, this would also help prevent students from stealing books. The librarian can't view all of the floorspace in the library from the quick convenience from her desk. Having to get up from her workspace every time a student is out of view — for safety reasons — is severely inconvenient

The librarian's desk is stationary; there is a need to expand her ability to monitor all parts of the library.

- Previous information given by the librarian shows that she wants the budget to be as minimal as possible, doesn't want to move the shelves or buy new ones, and doesn't want to move her desk.

### STAKEHOLDERS

The stakeholders are the librarian, the students, and the staff. The Primary stakeholders would be our teacher who is helping guide/fund the project and the librarian. The secondary being the students and the staff.

### IMPORTANCE TO STAKEHOLDERS:

The librarian, the students who use the library, and it should matter to all students in the school because it affects the library, which is a portion — no matter how small it is — of the school, therefore, all students and staff are involved. The librarian will be able to see across the entire library for safety reasons: a positive effect.

### DESIGN GOAL:

The design should be able to project visibility in spots that aren't possible to see from the librarian's current position. This matters to the librarian because she is the one who facilitates the library and has responsibility over the students. We can solve this problem by brainstorming ideas that would solve the issues of the blind spots. We will prove this solution actually works when it is able to maximize the visibility in the library.
