

Our problem is showerheads collecting mold and other things and how to prevent it by creating a new shower head. Everyone is involved because everyone has a shower and they need to clean it frequently. They are constantly cleaning their shower heads and it is tedious and some people are too lazy to constantly clean it. There is no unique situation that would prevent this problem, every showerhead will eventually get clogged. This is a large-scale problem that takes place in the everyday showerhead. This occurs in showerheads but our product could perhaps work for other types of pipes. The ultimate cause is minerals and soap residue getting clogged in the shower head nozzles.

While this is a problem that could affect anyone, it mainly affects certain groups. They are: hotel chains since they have lots of showers in their rooms; realtors because they sell people houses with showers; plumbers since they change the shower pipes; homeowners since they have their own showers; planet fitness because they have communal showers; pools because they have showers.

How important is this problem? This problem is important because whenever a shower is going in different directions it can make a mess on the floor and cause water flow to not be as smooth. Water leaking out without being noticed can cause mold in houses which can make people sick. This is why it should be considered and an important problem that needs to be solved now.
