

Element A:

- The problem is that disabled kids have a hard time participating in physical education in school. The effect of this is that these kids don't feel included. They have a harder time making friends because they can't do the same as other kids.
- Research: Studies by Watson, Sue. "Don't Assume That the Student in the Wheelchair Requires Assistance." *ThoughtCo*, ThoughtCo, 9 Feb. 2022, shows that you should treat them just like any other kid, some people may treat them differently because they're in a wheelchair, but just treat them the same as anyone else. Previous studies from "Wheelchairs (for Kids) - Nemours Kidshealth." Edited by KidsHealth Medical Experts, *KidsHealth*, The Nemours Foundation, kidshealth.org/en/kids/wheelchairs.html. Accessed 20 Feb. 2024 show kids in wheelchairs often get treated differently, not the same as other kids. They may be in a wheelchair, but they're still human. Previous studies by Charrette, Pete. "Adapted Physical Education Wheelchair Activities: 25 Fun and Engaging Movement Experiences for PE." *Capnpetespowerpe*, capnpetespowerpe, 16 Jan. 2023, show even though they're still in a wheelchair there's many things we can do in PE to increase their health and overall skills; such things like balance, coordination, and reaction time. They need quality movement education. There can also be attachments that can be added to the wheelchair to help incorporate disabled kids.
- The problem is that kids have a hard time participating in physical education. Research shows that kids in wheelchairs often don't feel included and may even get teased for being different. This is an issue because it can affect their mental health and make it harder to make friends. Research shows that there are many ways to incorporate kids in wheelchairs in physical education; such as skills like coordination, balance, and reaction time. We can also make wheelchair attachments for them to play certain games.
- Debbie LoCastro and Phil Isberner are involved with giving special needs children physical education. They go around from elementary, middle, high school helping disabled kids participate in physical education. The situation changes from kid to kid; there are some who are just in a wheelchair, some can only move an arm, some can only move a finger, and can barely move anything. This situation happens everyday. The problem to find ways for some of these kids to be included in physical education is massive because they need a physical education no matter what, and they need ways to feel included during PE too.
- Solving this problem can help parents of disabled kids, the teachers who teach them, and most of the kids themselves. I don't see how solving this problem could cause any consequences.
- Primary stakeholders are the special needs teachers. Their role in this problem is getting these kids a good physical education. The secondary stakeholders would be the parents. Their role in this problem is getting their kids to be included in PE. The main problems for this is giving disabled kids a physical education, Making them feel included, and getting them to play sports. Due to disabled kids not being included it makes it harder to make friends there is a need to include these kids in physical education.
- Research from Coe - *Students with Disabilities*, Accessed 20 Feb. 2024 shows that the number of students who needed special education in 2021-22 from ages 3-21 was 7.3

million. Which is 15% of all public schools. The number will continue to rise as we get older. We need to fix this problem so these kids can just be kids and not be held back because of their disabilities.
