

Element A

The task of this project is to design, test, and make a water filter. Why do we need a water filter? Well without safe water it could have chemicals or stuff that can greatly harm or even kill us.

Designing and testing this product could help with the understanding of making safe water and doesn't truly pose risks. Now why is this important? The need for safe water is a long standing issue that is all across the globe. Safe water is one of the most important things, we all need water to live and if it isn't safe we risk infections. Each year, 1.7 to 2.2 million people die due to unsafe water. That is deaths that CAN be prevented.
