

Element K

The problem was that plants were receiving too much direct UV sunlight, therefore they were dying because of it. We needed to protect these plants from the sun.

All of the members from our team came up with our idea and then we took ideas from all of our team members and incorporated those ideas into our design.

After we combined all of our ideas, we then made them into our design. We had four rollers with burlap around them and a plant in the middle on the base that provided adequate cover to the plants.

We didn't have the proper motor for our design. We had to adjust, trying everything to release some of the pressure off the motor. It still however wasn't enough, we tried to put stuff around our rollers to take more pressure off. Still though, it wasn't enough.

We tested out our prototype by running tests with the batteries and the motors to see if it would work. We burned up a few motors in the process because they were not powerful enough to spin around the rollers.

Many evaluators thought that our idea was great and they thought that our idea would work in the end if we had a proper motor for the design.

Everything went well aside from the fact that we didn't have the proper motor. We had great teamwork, and our idea was good according to us and our evaluators.

I think one of the best lessons that we learned throughout this design process was the fact that we all had great ideas and teamwork on the project. One thing we could all do is be more prepared for the project and adjust to the circumstances better for our project, even if we don't have our preferred items.
