

Engineering Design Process Summary (K1, K2)

Summarize each step of the design process including:

- defining the problem (elements A-C) *What went well? What didn't go well? Why?*

What was that the suppression was able to take out the fire from our house design. The thing that didn't go well is the detection system since there was nothing for the LED red lights to connect to to trigger the sound. There is not a lot of systems that works effectively and quickly than it should

- ideation (element D) *What went well? What didn't go well? Why?*

We started debating about our suppression system how it should attached to the ceiling instead of the balloons would be a tube with holes which connects to a water cup outside the design house

- selection & prototype design (elements D-F) *What went well? What didn't go well? Why?*

By the adding with a that idea sprinkler (from element D) we were going to start coding but since we started to late and didn't had enough time since we had a week left we decided to take a easier option.

- prototype building (element G) What went well? What didn't go well? Why?

We have made a miniature 8x12 cardboard with a width of 8 inches and length 12 inches making beds that were smaller than 4 inches, the thing that went wrong was the hot glue i stuck on with cardboard kept going everywhere around the 8x12 cardboard

- testing (elements H-I) What went well? What didn't go well? Why?

The test was unsuccessful since the water couldn't bring out the fire what should have done is the we shouldve use sand instead of water.

- evaluation (element J) What went well? What didn't go well? Why?

The stakeholders said that the idea for the suppression system and the 8x12 cardboard were as they expected but the detection system was not to the stakeholders standards.
