

Element K: Reflection on the Design Project

- Check Subtabs for each person submission/reflection
 - (Note: Our group are still in the process of building the desk, so we are doing elements K and L by documenting what we have been learning throughout the process and problems we have faced when starting to build, and finally using the feedback our exports gave us from our scaled version prototype and also when they evaluated our 3D model or the plan and design for the final design.)
 - After we have finished our project and final prototype completely, we will make sure to update the elements with the correct information and everything we experienced during the final building process of our desk.

Element K: Reflection on the Design Project

Reflecting on the Project Learning

What did you learn from doing this project? Think about what new things you found out while working on it. For example, "What new things did you learn about building things or solving problems during this project?"

From this project I learned it takes a lot of time and preparations to create a product. Some new things I found while working on our project is how to attach legs to resin. For example when you have resin on the outside you have to add wood inside of the resin in order to attach legs. Another thing I learned about resin is that you have to add solution B before adding solution A so that it mixes evenly.

Assessing the Process

What did you learn about your process for solving problems in general? Think about how you did things and what you could do differently next time. For example, "What things did you do well while working on this project? What things could you do differently next time?"

I learned that you have to address any mistakes that could possibly happen when solving a problem. I also learned that you have adapted to problems that may arise with preparations. Some things that I did well was help create the model and plan the design of the desk. Some things I would do differently is time management, but inevitably. Mr. R.N is our mentor and was working with us, but we couldn't work on our project due to his surgery. Mr. R.N was also our supplier, giving us the wood for a cheap price, rather than finding expensive wood online.

Evaluating Expert Reviews and Surprises

What did experts say about your project? Were there any things that surprised you while working on it? For example, "Did anyone else, like a teacher or scientist, look at your project? What did they say about it? Were there any parts of the project that surprised you?"

Experts, when they viewed our project said that it was going well. Our mentor Mr. R.N, since he is working with us, said that this project is going very well. Some other teachers looked at our resin table top and said that it was beautiful. Even though there weren't many experts saying that our project was amazing, and a lot of our peers were. Some things that surprised me when working on our project, is how resin worked. I have never worked with resin before so I didn't know there would be many steps before pouring resin into our desk.

Element K: Reflection on the Design Project

Reflecting on the Project Learning

What did you learn from doing this project? Think about what new things you found out while working on it. For example, "What new things did you learn about building things or solving problems during this project?"

I learned the different components to furniture building and planning. I also learned how to properly set up for and pour resin over surfaces along with the reality of prices for different materials. Constant feedback and constructive criticism was also necessary as we were unsure of a lot of things and needed to get them straightened out as we progressed more with the project. We as a group did not know much going into it, but as time progressed, we came out knowing more.

Assessing the Process

What did you learn about your process for solving problems in general? Think about how you did things and what you could do differently next time. For example, "What things did you do well while working on this project? What things could you do differently next time?"

We have to take things with a lot of precision, and be careful with how we deal with problems that may arise. In a project like ours, any little change could affect the complete outcome of the entire end product. We had to take any possible solution, and reduce them to the most optimal, but less invasive on the components that were already fine.

Evaluating Expert Reviews and Surprises

What did experts say about your project? Were there any things that surprised you while working on it? For example, "Did anyone else, like a teacher or scientist, look at your project? What did they say about it? Were there any parts of the project that surprised you?"

They were impressed with our plans and progress, and also added some feedback on changes we should make to better optimize our project. Mr. L.P also came over to look at us at work with our resin design, and he was mesmerized. I was surprised with how simple the process can turn out to be. There is some complexity, but a lot of it is creative design.

Element K: Reflection on the Design Project

Reflecting on the Project Learning

What did you learn from doing this project? Think about what new things you found out while working on it. For example, "What new things did you learn about building things or solving problems during this project?"

During this project, I learned a lot about the process of woodworking with resin. Before using resin on wood, there has to be preparations of the wood before we can pour. For example, in our project, the wood had to be on a non-sticky flat surface and clamp down so when we pour the resin, it wouldn't spill everywhere.

Assessing the Process

What did you learn about your process for solving problems in general? Think about how you did things and what you could do differently next time. For example, "What things did you do well while working on this project? What things could you do differently next time?"

One thing that I think we could do better as a group is communicating our plans. While we did discuss as a group our plans for the project including what we were communicating with our mentors, the types of materials we wanted to purchase, and the times we were working on the project, there were some moments where we had to do something that we didn't account for, such as budgeting and purchasing our materials.

Evaluating Expert Reviews and Surprises

What did experts say about your project? Were there any things that surprised you while working on it? For example, "Did anyone else, like a teacher or scientist, look at your project? What did they say about it? Were there any parts of the project that surprised you?"

Some experts like Mr. R.N and Mr. L.P looked at the resin table and both said it looked amazing. Mr. R.N even said this might be one of the best community projects he's ever worked with. Something that surprised me was that resin can overheat. I didn't know that resin could heat at all so I was kind of surprised that we had to do a first base then a second base of resin.

Element K: Reflection on the Design Project

Reflecting on the Project Learning

What did you learn from doing this project? Think about what new things you found out while working on it. For example, "What new things did you learn about building things or solving problems during this project?"

From doing this project I learned a lot when it came to construction work especially when building a desk and also learned how to solve problems that occur or are benign faced to me when me and my group have been working on building the final prototype of our desk. Examples could be that before I never learned how to use a saw, properly measure wood, or how to sand wood, but for this project I have learned on how to do these types of stuff which in the future I can apply these concepts when having to design and build a different prototype. I learned how to work with resin and resin art when it comes to having inclusions with resin. I learned that if we want inclusions with resin we must spray polyethylene, so that the resin can work effectively when adding the inclusions. Throughout our building process we have faced some difficulties such as when it comes to actually being able to stay on the building process of our project where our meteor, Mr.NUsum was out on medical leave. Also, we faced difficulties when it came to gathering materials because of our budget and overall having to make some changes to the design of the desk which are sometimes pretty overwhelming to do. I had to think of solutions when it came to the structure integrity of the desk, such as facing the problem of doing open shelves for the bottom of the desk. It was something that our stakeholder would have really loved, but we had to change it due structural reasons and ensure the desk was durable and would help her when it came to storage as well for her office supplies. Furthermore, during the building process and overall planning of our project I have learned a lot more in construction and have created a strong mindset with the motto, that when there is a problem, there can always be a solution.

Assessing the Process

What did you learn about your process for solving problems in general? Think about how you did things and what you could do differently next time. For example, "What things did you do well while working on this project? What things could you do differently next time?"

What I learned about the process and my experience for solving problems in general is that when faced with problems act calm and think carefully. During my experience when facing problems I was very overwhelmed, but I learned with my teammates that if we try to solve these problems carefully and thoroughly everything will turn out okay. There are many things that I would do differently next time if I were to do the building process of the desk again. Right now things I have done well in my building process have been planning and doing the layout when it comes to

the resin art and also measuring out the amount of wood and resin we need for this project.. Something I would have done differently was planning more in depth of the schedule for the building process of this desk because due to us not planning our schedule as we should Mr.R.N left for a medical reason, causing us to delay the building process of our desk and not being able to finish it by the deadline. In addition, when it came to our materials, I wish we didn't really have that much on our mentors because even though our mentors are there to help us, we could have been a little more independent and found the wood we would use for the desk. Furthermore, these are things I have been doing well and things I have seen I could do differently next time in the stage of my building process of my prototype right now.

Evaluating Expert Reviews and Surprises

What did experts say about your project? Were there any things that surprised you while working on it? For example, "Did anyone else, like a teacher or scientist, look at your project? What did they say about it? Were there any parts of the project that surprised you?"

Our main experts such as Mr.R.N and Mr.T.B really did like our project and the idea that we had for the design of this desk. They loved that resin art ideas and overall the whole vision we had for the desk and have guided us through making some changes when it comes to structural integrity or that could better enhance the design and effectiveness of the desk for our stakeholder Ms.A.V . Some things that surprised me while working on our project is that due to our group working was that Mr.R.N has talked to some of his classes for the project we are doing which makes my group and happy a lot because we are happy for him to be helping us and to talk about us so product like that. However there hasn't been any teachers or scientists looking at our project except just Mr.R.N our mentor and Mr.L.P who is our teacher. Furthermore, the students of Mr.NUsum class said that this was a very complex project and overall I was just surprised that he was praising us to his students. We hope that later on in our building process or after finishing the final prototype of our desk that other teachers from our building can see our project and give honest feedback.
