

Element K: Reflection on the Design Project

Lessons Learned:

1. Surface testing is not enough—submersion introduces real forces
2. The tether adds a lot of weight- it needs to be given something to lessen weight
3. More test time = fewer failures
4. Finalize design earlier so training can begin
5. Don't over-engineer—simplicity wins underwater

These reflections shaped a more grounded approach and informed both this report and the next ROV build cycle.
