

1. We knew that the chickens needed a better, more sustainable water source so from hearing from the stakeholders and what they needed we did research online about what ideas and things that had already been out there and kind of got inspiration from that. We had gone up to the coop just to get an idea of what we were working with and where everything had been.
2. Everything had run pretty smoothly. We had to cut things down and go through some trial and error when it came to where to put things and how it should look and when it came to ordering materials but once we had everything we needed it all worked out and everything had started to come together.
3. Things that we really learned throughout this process had been trial and error and designs such as this one will take time and really making a list of things we need and drawing up the idea of how it should look.
