Reflection on the Design Project

From this project, we have learned how important every little detail in the design process truly is. For example, we did not account for the wrinkles on the cardboard, which created a blurred effect on the mirror. If we had thought about every part of the model, including the cardboard texture, it is possible this problem could have been avoided.

What went well?

However, many things went well for the design. One thing being the shape and arc of the mirror and the mirror also being convex.

For future attempts, the suggestion to test the mirror where we would put it in the future, made by Professor Cocker, will likely lead to a better visibility scope, because we would know exactly what the finished product would be able to detect.
