

ELEMENT K

What worked on our project was our prototype's ability to dispense the lacrosse balls as well as the button and the opening latch on the top of our ball dispenser. Due to our planning and risk assessment, we were able to identify potential flaws in components of our project including the handle, body, button, and wheels which are all things that we plan to change when constructing a similar project. When reflecting on our project, we believe that we could also change the wood rest at the bottom of our project. For our project to not tip over, we decided to add a rest at the bottom of our project, from future observation and tests we were able to realize that if too much weight was exerted on this wooden plank it would cause the project to fall forward which could damage the components on the inside of the project and if repeated could cause our project to not function anymore.

Looking back at our past steps, we as a group were able to learn and utilize many lessons. Lessons we prioritized and believe could help future students plan to do background research and development of a prototype. These lessons could help future students because if you plan, you don't have to waste time trying to figure out what you want to create. If you do background research you're also able to research similar projects and use some of their ideas or materials that they used for the construction of your prototype as well. Finally constructing a prototype is something we believe is a lesson that can greatly impact future students as with a prototype you can see your vision come to life, this helps in fixing noticeable errors for your final design but also aids in seeing the functionality of your final design may work as well which is what we believe greatly impacted the result of our final prototype.
