

- a. Defining the problem - the current chariot design negatively impacts the Garrison Forest middle schools ability to win the annual chariot race against Bryn Mawr.
 - b. Brainstorming- we brainstormed what our group would be able to do to improve the chariot with the resources available to us and with the amount of time we had. We realized that it would not be possible to alter the metal that makes up the chariot because it is welded together. We thought of other ways we could fix the design, such as the size of the tires, the tread of the tires, the weight balance, adding grips, and the physical appeal of the chariot design.
2. A. Defining the problem- Once we got further into the project and compared Bryn Mawrs chariot design to our current design, we realized that the main issue lay within the tires, as the tires had lost their tread so there was more friction, which caused the chariot to move slower. What did not work well for us when we tried to order new wheels and a new expander. This did not work because our measurements were off. We also wanted bigger diameter wheels but that was not able to happen. Maybe we could have gone to more tire shops and compared more wheels to really see the difference from experts but all in all it turned out to work for the purpose we needed.
3. We learned that your ideas may not be feasible but in the end, something will work out. We learned how to communicate with more adults and take in their knowledge to add to our ideas.
