Element K:

We felt this project was a very valuable learning experience for us. At first we were planning to use the 3d printer to create our project but that plan fell through as the 3d printer broke and so we were forced to switch to wood. We had to first cut out the wood and then measure it so it fit our blueprint. After this we tried three different types of glue to use for our model; wood glue, hot glue, and caulk. The caulk ended up working the best out of all three, and held our model together pretty well. Finally we spray painted the final design to meet the request of our stakeholder.
