

Element K: Reflection on the Design Project:

I think this entire project could have been done better. Starting with the fan itself. My research told me that a centrifugal fan would work the best for compressing air but I now believe that this fan is not a centrifugal fan. Then the adapter. It could have had a more gradual angle to potentially increase the air flow and then the port from the adapter to the air hose could have been more aerodynamic. Then the nozzle. The nozzle drastically decreases the effectiveness of the whole system and slows air flow throughout the entire thing.
