

B

Mr. Kiser has previously done nothing to solve this problem that he has been having, but there have been other attempts to make a solution. Indirect solutions to this problem have been issued by the MedicalNewsToday team and they suggest resting the back for 1 to 3 days to reduce muscle pain and/or nonsteroidal anti-inflammatory drugs. The issue with only using medication is that it only is in effect if the problem has already occurred. The purpose of this solution is to prevent, not just lessen the problem.

One existing cart extender that was found on Amazon was by Sheng Yi. This handle is a 17cm extension made of metal and rubber for the handlebar. It has clasps on the end with a screw to tighten it. An advantage to this product is that it is very simple and pleasing to the eyes. However, it doesn't accomplish the prompt of adjusting to differing heights, considering that it stays at only 17cm. Along with that, the clamp that connects the handle to the cart is circular and only 28mm, not allowing for most carts to connect, only circular and small handles. A possible way to overcome the adjustability problem is to add a row of notches that click into different lengths. To fix the attachment issue the circular clamp should be changed to a clamp similar to a belt, which can latch into different holes for different sized diameters.

A different type of handle adjustment is also from amazon, but it has buttons on the side to adjust the angle of the bar. The vertical bar to support this extender is attached to the cart by two black clamps, measuring 12.5 cm long, with screws similar to the last one. The vertical bar is 41 cm, allowing for extension of 30cm. The horizontal bar is 51cm leaving lots of room for the hands to move and it is circular for good ergonomics. The buttons on the side allow for easy adjustment, but a shortcoming of that is the consumer needs to have both hands free to use. The advantage of this handle is that it is appealing to the eye, almost looking natural attached to the cart. To solve the problem of needing both hands free to adjust the height or angle of the cart, a simple fix would be to just create it so only one side controlled the whole adjustment.
