Element B: Documentation and Analysis of Prior Design Attempts

In the first paragraph, it says “shade cloth is a lightweight knitted polyethylene fabric that provides plants and people with protection from the sun. Shade cloth fabric is available in densities ranging from 30% to 90% to suit the unique needs of different types of plants, flowers and crops.

Details

It grows up to 3 feet high. Native to Madagascar, Réunion, and Mauritius, it is widely naturalized in the tropics and subtropics. They can be hard to make or look nice and they also are inconsistent with their coverage sometimes, because it does depend on the size of your plants and garden. On top of that it is only really used in tropical areas.

Burlap was used to cover the crops and was used as an inexpensive shield against some of the sun. Allowing the plants to get a certain amount of sunlight but not too much. Though burlap was inexpensive, it wasn't as reliable and could be woven differently from fabric to fabric. It also was less durable than other choices. This could be a good option if you're trying to go for a cheap shielding tool.

Image

You can use these nettings for greenhouses, horticulture, and flower and fruit growing. The fabric is strong and flexible, and can be used for a long time before it breaks in normal and good conditions. The material is high density HDPE and has a shade ratio ranging from 50% to 90%. And it also has a variety of colors. It is not hard to make and is very easy to put up with the right amount of people. These things are really ideal and helpful when it comes to shading plants.

In the fifth paragraph, it states “Plastic can be used to protect plants from frost, but it’s not the best or most effective material. In fact, the horticultural experts here at Green Impressions actually recommend against it. Plastic materials such as vinyl and traditional camping tarps aren’t breathable, causing moisture to get trapped inside. Tarps are prone to things such as poor airflow, overheating, limited light, wind damage, water blocking and sometimes struggle with durability issues. They can often prevent rainwater from reaching the plants
