

Element B: Documentation and Analysis of Prior Design Attempts

To better understand potential solutions, we researched various ways of making rain beds currently used by other schools and companies. Some departments rely on water beds as a source of beautification, while others use them as a way to stop flooding in the area. Within our school, past attempts to improve flooding and beautification have included putting in new turf and making spots for water to drain into, but the school still gets flooded a lot and lacks some natural beauty around campus. By analyzing these previous efforts, we identified key areas for improvement: adding plants to help with the absorption of water, and including more areas that have not been covered when flooding occurs.
