

State the source of the information about this prior design attempt, which should be taken from any of the following credible source categories: peer-reviewed journals (check out your public library for free digital access to journals; here are some free online journals and research databases), professional organizations, government agencies, local and national newspapers, patents (here is a patent search site for the United States Patent and Trademark Office), and reputable vendors and manufacturers. Make sure to incorporate in-text citations in the details section below (i.e. don't just give)

Details This image shows how this Fabric is protecting the plants from getting frost and letting cold air get on the plants and from keeping it from dying. It will also capture the heat that it absorbs from the ground. Plastic can be used but don't let it touch your plant because if you do then it will be worse than no protection because it can hold moisture and can cause a more serious freeze damage.

Details This shows how to get water down to the plant and into the roots. You want to water where the roots will be but don't put too much water because you will kill the plant by flooding it. The best time to water your plants is in the morning because that way the leaves get wet and they have all day to dry.

Details - This will keep the plant from frosting and dying. It will also help with the plant not getting too much sun so that way it will have shade.

Details

Creates a warm, protected environment for transplants

Accelerates growth by a 25%

It covers the plants from cold temperatures and chilly winds

This piece will be a protective boundary for the plant and also keep the plant warm. It will cover the plants from cold temperatures and frost in the early morning.
