

Element B: Documentation and Analysis of Prior Design Attempts

To better understand potential solutions, we researched various storage methods currently used by other schools and art studios. Some art departments rely on plastic bins, while others use pegboards or rolling carts. However, these systems often fail to provide adequate categorization for smaller supplies, leading to continued disorganization. Within our own school, past attempts to improve storage have included repurposing old bookshelves and using labeled plastic drawers, but teachers reported that these solutions did not fully meet their needs. By analyzing these previous efforts, we identified key areas for improvement: modularity, durability, and space efficiency.
