

Element J

We have gotten three separate opinions on our handle, specifically those of Michael Kiser, our primary stakeholder and resident tall person; Peter Hermann, an engineer in the salesforce; and Piper cannon, an engineering education student from Vanderbilt University. From mr. Kiser, we learned that our design was too flexible and needed to be solidified, specifically during turns. We worked with mr. Hermann to find a solution to said problem, and he suggested that we try other materials, specifically steel and wood. This is what set us on the track of 3D printed collars, since the metal stock we have is far smaller than the PVC, and Miss Cannon advised that we keep the rough width of the PVC that we were using at that time, given the ergonomic component of pushing the cart. She also confirmed our growing concerns about joint weakness in PVC, and the 3D printed sleeves to mitigate said weakness was also ideated by her.
