

Element J: Documentation of Evaluation

Stakeholder Evaluation #1

- Name
 - Mrs. Tatro
- Justification
 - We are trying to directly solve her problem that she gave us and fulfill her expectations. Also, the success and functionality of our book end is important to her as the librarian.
- Evaluation Documentation
 - “What is the bottom made of”
 - “Is it sturdy? Is it renewable?”
 - “Its good that the cardboard is sturdy”
 - “The design is very pretty”
 - “Is it a hard process to make?”

Stakeholder Evaluation #2

- Name
 - Mr. Eisenberg
- Justification
 - As our engineering teacher, he has expectations for our project and wants us to use the materials he has given us wisely.
- Evaluation Documentation
 - “You kept the simple design and you paid attention to the aesthetics. I like how you used refurbished material so it’s environmentally friendly. It looks good.”

Stakeholder Evaluation #3

- Name
 - Aniera Ayompe
- Justification
 - She is a user of the school library and wants to be able to see book displays and utilize functional bookends
- Evaluation Documentation
 - “Design is aesthetically pleasing”
 - “Holds up well with multiple books”
 - “Uses provided materials well”

Field Expert Evaluation #1

- Name
 - Mrs.Crenshaw
- Justification
 - As a commercial architect, Mrs.Crenshaw works professionally with sustainable building designs and material selection. She works with making sure buildings have good structural integrity, aesthetics, and sustainability. As such, she is qualified to judge our design on its structure, how sustainable it is, and its aesthetics when placed in a library that others will use. We had to architect our project, and as such an architect themselves is in a field directly related to our project.
- Evaluation Documentation
 - “Feels substantial”
 - “Very pretty”
 - “I like that there are also designs on the sides because that's what you'll see when it's on the shelf”
 - “Make the bottom more level”
 - “Use something to add friction to the bottom to prevent sliding”
 - “Weight on it is good for preventing sliding”

Synthesizing the Project External Evaluation

- The aesthetics of our bookend were compliment very well. The design on the side allows for people to view the design even while the bookend is in use. The design is sturdy and renewable, and the bottom is made out of cardboard that can properly sustain the weight of any books placed on it.

Yielding a Meaningful Analysis

- Our project is very well designed and engineered. The most important part of the project, that almost all stakeholders commented on, is the bottom part and how well it prevents sliding, is able to last, and is sturdy. The bottom part is a critical piece of the design. We discussed how to make it work with Mrs.Tatro and Mr.Esisenbrug as well. Most opinions were very positive, especially towards the aesthetics/design.
