

Element J: Documentation of Evaluation

For our school rain garden project, we got feedback from UMD teachers and students, our maintenance supervisor, a local landscape architect, and someone from the city's environmental department. They helped us look at how well the garden handles rainwater, whether our plant choices made sense, and how easy it is to take care of. They suggested we adjust the slope for better drainage, add more native plants for pollinators, and use mulch to keep moisture in. We used their advice to make improvements and make sure our design works well and lasts.
