Element J: Documentation of Evaluation

Stakeholder Evaluation #1

- Name of evaluator: Jennifer Beaton
- Justification for how this evaluator is a **stakeholder**: Fire Protection Engineer
- Ms. Beaton came to our school, James Hubert Blake High School, to have a conversation with every single group who participated in the Burn Day project. When she got to our group she talked to us about what we could improve in our suppression system. She told us that we should use a slightly bigger tank/container of water to make sure that we do not run out. We were also told that instead of making holes in the tubing, we should put straight line slits in the tubing because the water would still flow through the tubing and be released, but it would allow the water to spray more surface rather than just one spot. We had originally planned to disassemble a smoke detector but we were advised not to do so as it might not work correctly and/or how we intended.

Field Expert Evaluation #1

- Name of evaluator: Burn Day Judges
- Justification for how this evaluator is a **demonstrably qualified field expert** (professionals who spend at least a portion of their time working in a field directly related to your project): They are judges for the project we participated in. They worked in the fire suppression engineering field. They judge for this project every year.
- Documentation: They judged us on the project we were given, we were not given any negative feedback on our project.

Synthesis of the Project External Evaluation

We were told that we needed to be slightly simpler in our suppression system. We didn't need to disassemble a whole smoke detector. We didn't need to drill/cut holes in the tubing, just make small slits. And overall, just not over complicate the project because it would be unnecessary to do so.
