

Element J: Documentation of External Evaluation

The development office at our independent boarding and day school has an overflow of items. The excess items piled on the floor hinder workflow and efficiency. Many items move around the development office; therefore, it is important to keep them organized. The current storage situation is unsatisfactory in the eyes of school donors and visitors.

We consulted three individuals with extensive experience in engineering, woodworking, and construction. One is a professional engineer, another teaches woodworking, and the third has years of hands-on construction experience. Their backgrounds made them well-qualified to review the technical aspects of our project and provide informed feedback on structure, material choice, and design.

All three experts recommended using $\frac{3}{4}$ inch sanded plywood due to its strength, durability, and reliability. Based on this advice, we selected $\frac{3}{4}$ inch plywood as the primary material for our project. One of our experts, Mr. C, suggested adding trim to the front of the shelves to cover raw edges and create a cleaner, more polished look. Both Mr. H and Mr. M emphasized the importance of bracing to prevent the shelves from collapsing. It was also advised that we add backing to the upper shelves to improve structural integrity and reduce bowing. Painting the shelves was recommended as well to enhance the appearance of the final product.

We incorporated these suggestions into our updated design: reinforcing the large section with bracing, adding trim for a finished appearance, including backing on upper shelves for stability, and selecting a cost-effective, high-quality plywood.

The feedback significantly improved our project. By following expert recommendations, we made smarter material choices, enhanced the design's strength, and improved its appearance.

Happy Hoppy Frogs
Development Office
Spring 2025

These changes ensure the final product is more durable and meets our goals for quality, safety, and efficiency.
