

Part J: Documentation of External Evaluation

From the very beginning of our tree stand project, we understood the importance of consistent feedback and expert consultation. Given the nature of our design—a 3D-printed tree stand—we made it a priority to gather external evaluations at every critical stage. Our primary stakeholders included avid hunters, safety experts, and seasoned outdoorsmen who provided critical insights into the usability, safety, and practicality of our design.

Initial Questions:

What is the maximum weight capacity you expect the tree stand to hold?

- Response: "Ideally, it should support at least 300 pounds comfortably."

How portable do you need the design to be?

- Response: "Portability is key. I'd like it to be easy to assemble and carry without too much extra weight."

Are there any specific materials you want to avoid due to noise or durability concerns?

- Response: "Yes, anything that creaks or rattles is a no-go. The quieter, the better."

Do you prefer a single-person design, or would you want it to support two people if necessary?

- Response: "Primarily single-person, but the option for two would be a bonus."

Would you like it to have built-in safety features like harness attachment points or a padded seat?

- Response: "Definitely, especially harness points. Safety is the top priority."

With these responses in mind, we initiated our design sketches and prototypes, keeping safety, portability, and noise reduction at the forefront.

Prototype Evaluations:

Prototype 1:

Hunters: "It looks sturdy, but I'm worried about noise when you shift your weight."

Safety Experts: "I would add more secure points for harness attachments."

Outdoorsmen: "It's lightweight, but I would test it in rough weather before finalizing."

Prototype 2:

Hunters: "Much quieter now! The new materials help a lot."

Safety Experts: "The harness points are better positioned, but I'd recommend reinforced joints."

Outdoorsmen: "The portability is great, but I'd like to see a more intuitive folding mechanism."

Prototype 3:

Hunters: "This is the best one yet. It's quiet, strong, and packs up easily."

Safety Experts: "No concerns with safety. The reinforced joints and added harness points are spot-on."

Outdoorsmen: "It's finally ready for real-world testing. I would take this out without hesitation."

Final Evaluation:

After conducting our tests and iterating based on external feedback, we returned to our experts with the final design. The reception was overwhelmingly positive. Hunters were impressed with the reduced noise and increased stability. Safety experts signed off on the harness attachment points and overall structural integrity. Outdoorsmen praised the improved portability and intuitive folding design. The feedback gathered was instrumental in refining our final product, ensuring it met both safety standards and user expectations.

Overall, the external evaluation process was crucial in elevating our tree stand project from a basic concept to a fully-realized, field-ready design.
