

Element J

Project evaluation includes providing feedback on the prototype, reviewing the testing results, providing feedback on the analysis of the testing results, and providing recommendations for improvement. Project evaluation should address 2 or more aspects of your design or engineering design process. Duplicate the evaluator template as needed if you have more evaluators than are listed in the template.

Some of the feedback we received on our prototype was that we all seemed to understand the idea as well as the problem that we had to overcome by creating a prototype. They said to preserve and keep designing. Every part we fixed would almost always lead to another thing that needed to be fixed. We had a creative concept using the idea of blinds due to time and lack of materials. Thinking large scale, difficult to envision in an agricultural setting however possible. And to keep going. Some more feedback was that there were problems with the motor, but it works manually. Some troubleshooting, and that it was a lot for us having to redo it 3 times. Other feedback was that we didn't read off of the slide, that we had trouble attaching the battery, we had great thoughts, and a good explanation. Others said we used our minds for executive function and that it was good we even considered a way to water the plant. Really creative design using blinds, while using existing ideas for adjusting from the original plan. Good shared effort in presentation.

The testing results didn't go as we all originally planned for it to go. We experienced many problems while doing the testing and everytime we were able to fix a problem we experienced more problems. We tried our best fixing the issues but couldn't because of lack of time and materials.

We had some feedback of the testing results that the engine did not function correctly and would make the gear piece fly off. And that the blinds had to be closed manually to make it function correctly to shade the plant.

Some recommendations that were said to fix the issues was to put the engine at a different angle and to find a less powerful battery to make it not spin so fast. And that we should also add something to give the plant more of an airflow so it gets enough oxygen. Another suggestion was to make the blinds more sturdy because some were broken and that we should maybe use a different type of blind that were maybe wooden so they wouldn't break so easily.

Our project mainly revolved around 2 aspects. One was being able to have a 10 by 20 black plant tray that could hold plants and we were able to measure our wood to fit a 10 by 20 plant tray in it and not have any problems with it. Our other aspect was having mobility involved with the

project so our group decided to use blinds and attach it to a motor that had a spinning motion so the blinds could open and close.
