

- Our first stakeholder is Ms. Seltzer. Ms. Seltzer is an 3-D art teacher who teaches jewelry making, woodworking, and 3-D design. All of these skills are needed in our project because the frame is wood and we had to laser cut.
 - Another stakeholder is Ms. Bussey because she asked us specifically to design for this space.
 - Another stakeholder is Mr. Beam. Mr. Beam is our engineering and design teacher that gave us the project and the criteria. He will also be grading us on this project.
 - The Last stakeholder is Mr. Vogel is the maker space technician. He helped us cutting our mirrored acrylic so we didn't waste as much.
1. The only feedback we got was from Mr. Vogel and Ms. Seltzer
 - In this email we sent a visual update of our project to Ms. Bussey so she could keep up and see what was going on. She said it looked great and didn't have any feedback to give.

- Ms. Seltzer gave us some feedback. This included using nail polish remover to get the paint off the string which worked very well. She also told us to make all the strings relatively even to eachother so it looked more neat.
 - Mr. Vogels gave us advice to use his template to cut the mirrored acrylic so we would waste less. Which helped us save 20+ squares.
2. Ms. Seltzer's advice and feedback helped us make our installation look more neat. By cleaning up the paint on the string and cutting them to make them the same length made the installation look a lot more professional.
