

Element J

We had a handful of people review our project, whether they be stakeholders or qualified field experts. The experts that reviewed our work were both theater professionals and engineering students from Duke university. Each of them gave detailed advice on how to carry out the project and offered tips and techniques to increase the efficiency of the rose system, some of which we implemented in our final prototype and some of which we didn't. Examples of advice that they gave are

- “make the flowers fall pretty. Don't let them lose their look for function” -stage manager
- “Buttons are hard to push for the stage actors. Especially if it's the Beast and he's wearing gloves” -another stage manager
- “explore other options to not use motors” -a four year graduate named Piper
- a remote is very difficult and intricate so it would be better to find other solutions
- use three motors, one for each scene -Piper
- make carves into dowels to lengthen string -Piper

The stakeholders that we received feedback from were the stage director Mrs. Moody and an actor that would be participating in the play. Besides the criteria she put forth, Mrs. Moody's feedback was largely based on the appearance of the flower such as decreasing the stem diameter and making the petals appear more realistic. The actor gave us the advice to steer away from physical operations onstage because no actor would be available to pull the petals off, leading us to lean toward the remote control route.
