Element J Initial Template

How to use this template

Teachers: You may customize this document before providing it to students.

Students: If you make a copy of this template to edit for your own record of expert evaluation, be sure to delete the instructions.

In order to earn a 5 on this element, you will need to collect project evaluation from 3 or more stakeholders and 3 or more demonstrably-qualified field experts. Project evaluation includes providing feedback on the prototype, reviewing the testing results, providing feedback on the analysis of the testing results, and providing recommendations for improvement. Project evaluation should address 2 or more aspects of your design or engineering design process. Duplicate the evaluator template as needed if you have more evaluators than are listed in the template below.

Element J: Documentation of Evaluation

Stakeholder Evaluation #1

- Name of evaluator: **Mr. L**
- Justification for how this evaluator is a stakeholder: He assigned us the project.
- Documentation of the project evaluation, which could include copies of emails, transcripts of conversations, filled out feedback forms, etc.

MR L. Primary stakeholder in the project, as it is his shop that houses the machinery that necessitates the construction of the blast gate in the first place, and it is him who gave us advice and feedback on implementing the solution long term in his workshop.

After showing him our initial prototype, Mr L. gave a couple of important pieces of feedback.

Name: _____

Date: _____

Class: _____

- It's a good solution, in theory and almost in execution.
- The lever is a bit janky. (something we were aware of)
- If perfected or recreated, then he would definitely implement it into his shop.
- Overall, a good solution, just with kinks to work out

From his feedback, we became aware that this solution was definitely something that he would want to implement, and he was happy with the lever and gate that we designed, only gripes coming from the craftsmanship and its functionality. This feedback means that all we would have to do to satisfy the client is to either recreate the gate with a much higher quality, or to fix the issues plaguing the current iteration before implementation.
