MyDesign Portfolio

Element J Initial Template

Stakeholder Evaluation #1

- Name of evaluator: **Edwin Maria**
- Justification for how this evaluator is a **stakeholder: Drives long distance, 40 minutes to and from work every day.**
- Documentation of the project evaluation, which could include copies of emails, transcripts of conversations, filled-out feedback forms, etc.

Face-to-face conversation

Explained that driving long distances and spending more time in the car allowed more opportunities for items to fall the car seat gap. "Driving here and there for so long just gave the items more time to fall", "That car seat device you made can really make a difference", he added.

Stakeholder Evaluation #2

- Name of evaluator: **Ryan Butchko**
- Justification for how this evaluator is a **stakeholder: Details cars and is a car lover.**
- Documentation of the project evaluation, which could include copies of emails, transcripts of conversations, filled-out feedback forms, etc. **Face to Face conversation**

Told us that having the device in the car helps with cleaning because it has a nice design and makes car consoles more organized.

Name: I Forgot Again Team **Date:** 5/24/24 **Class:** Engineering

Stakeholder Evaluation #3

- Name of evaluator: **Aiden Dixon.**
- Justification for how this evaluator is a **stakeholder: Had previously been a pizza delivery driver.**
- Documentation of the project evaluation, which could include copies of emails, transcripts of conversations, filled-out feedback forms, etc. **Face-to-face conversation.**

Described how on the job he was constantly searching for his phone to track orders and constantly was dropping his phone. Said how our device could limit the chaos and help drivers. Mentioned how the organization of items in the compartments makes driving simpler.

Field Expert Evaluation #1

- Name of evaluator: **Dr. Cadou**
- Justification for how this evaluator is a **demonstrably qualified field expert** (professionals who spend at least a portion of their time working in a field directly related to your project): **Mechanical and Aerospace Engineer**
- Documentation of the project evaluation, which could include copies of emails, transcripts of conversations, filled-out feedback forms, etc. **Face to Face Feedback**

Dr. Cadou was at first skeptical of our design but was able to offer a few suggestions like adding a lid to the device which turned into our iteration. Liked how we used foam padding on the inside of the device and recommended possible ideas for materials we could use if we were selling the device.

Field Expert Evaluation #2

- Name of evaluator: **Serena Rudnick-Cohen**
- Justification for how this evaluator is a **demonstrably qualified field expert** (professionals who spend at least a portion of their time working in a field directly related to your project): **Industrial Designer**
- Documentation of the project evaluation, which could include copies of emails, transcripts of conversations, filled-out feedback forms, etc. **Transcript: "If you**

want this to go into different cars, think about making it out of a different material that is flexible or stretchy like a fabric for example.”

This advice helped us look at our device from a different perspective by thinking about the real-world applications of this device. For example, it raises questions about the materials and the usage of the device.

Synthesis of the Project External Evaluation

Overall, the stakeholders and field experts were in support of our design and provided positive feedback for our project. Most of the recommendations made us reconsider our design choices and what our device could be in the future. We took feedback from these experts and made it into our iteration of our design. Their analysis was important in determining how the prototype could be used by others. One thing we should think about is how others might use our device differently from how we intended.
