

Element J: Documentation of External Evaluation

During the project my teacher was there to give some feedback on the water filter. She was also the one who got the supplies so I could build the filter. In the end the filter did not work. She asked me what different things I could do to possibly improve it and make it work better. I was thinking if I used the materials in a different color if it would work. I could have also put more of different materials into it and maybe that would have made it work better. If I would have spent more time on looking at the results and improvements on other filters I could have possibly made mine better and changed some of the things in the design of it.

Overall the main need of the water filter was that it needed to be able to turn dirty water into clean water and get rid of the contaminates inside of the water. The biggest flaw was that it could not properly do this so it would need to be remade with some changes to materials, bottles possibly, and the location of materials in the filter.
