

My Design: Adaptive Technology
Armin Zarbaft, Jared Wagner, John Estock

Element J: Documentation of Evaluation

We remained in contact with Ms. Brennan, who is the head teacher of the special needs classroom at Whitmarsh Elementary School, throughout the whole design process.

In our first email contact with Ms. Brennan, we asked her to verify our list of priorities which consisted of the following:

1. More storage space and improved organization (high priority)
2. Appealing tactiles (high priority)
3. Interchangeability (high priority)
4. Accessibility (high priority)
5. Cost (high priority)
6. Durability (low priority)
7. Uniform design (low priority)

She replied and gave her thoughts on our list, adding that she felt it was important to keep track of a timeline so that we didn't start a project that got in the way of the children's space without finishing. This email as well as our response to her feedback is shown below:

Good Morning!

List looks great.

I would also like to add the importance of the construction itself and timeline for it to be completed. Is your group thinking about completing in phases? This timeline is important as the construction and improvements can impact the students' ability to access the space. This is a space accessed multiple times a day. Something to plan for on this marvelous journey!

Good morning Ms. Brennan,

Thank you so much for responding; we always appreciate your feedback. We will definitely implement a timeline and prioritize it as it is of utmost importance that any projects that are started are also finished. Before we go over our design plans, we were wondering if there were any major plans that the classroom has that we should consider in a working timeline.

We would like to meet to talk about plans and timeline soon, so please let us know what day of the week you would like to meet.

As always, please let us know of any additional concerns and questions.

Thank you,

Jared Wagner

After this, we contacted Ms. Brennan set up a meeting where we could present some of our ideas and narrowed down with her which design she preferred.

We contacted her during the design process for any changes that we had to make to our design, such as when we made the two middle parts of our door stationary. We received positive feedback, indicating she had no reservations in regards to the changes.

We then contacted her to find out what timeline worked best for her so that we could install the doors in the middle island at a time when she could supervise us and ensure the kids wouldn't be there.

After setting this up, we successfully installed our doors, shelf supports, and stationary panels in two installation sessions. We noticed however after installing that we would have to add a magnet to the door, since they weren't closing fully. Additionally, the right door's installation was a bit off, making it hard for it to be closed without hitting the bottom. The only easy solution to this is to lift the door when you want to close it.

Summary of Evaluation:

After the installation, Ms. Brennan seemed very happy with our work and was excited to utilize the newly available space. She was even content with working around the problems that there were. For example, she said she would put files that she would not really need to access readily in the right side since that door is harder to open and close. She was also happy with the magnet solution we assured would be installed.

We gave her a form to fill out and discovered the following results:

- Ms. Brennan is satisfied with our group choosing to drop the tactiles and cubby doors to just focus on the middle island doors.
- When asked what issues she had, Ms. Brennan said she looks forward to the magnets being added, which is currently in works.
- On a scale of 1-5, Ms. Brennan rated our project a 5 in level of practicality our project had on a large scale compared with other projects. This means that according to her, our project will have a lasting impact.
- Ms. Brennan commented that our group did a 'great job seeing the project through from start to finish'.

Overall, the major takeaway from her comments is that we need to have the magnets installed and that we should be happy with our progress overall, as our project will be playing a huge long-term role in the sensory space.
