Good afternoon,

We have finished the construction of our fiber optic board, and we were wondering when we can come and install it? It requires drilling just so you know.

Thank you.

Good Morning,

Yes let's setup a date. I apologize for the late response.

I can have you come in anytime from 6:45am- 10:00 am on most mornings. Do you need the smell board moved? Looking forward to hearing from you!

Good afternoon,

Yes, we do need the smell board moved. If you wouldn't mind shooting us an email when the cubby is ready, then we can arrange an installation date from there.

Thanks so much.

Ms. Brennan,

We hope you are doing well. This is the project design we are currently leaning towards. Below, we've included an onshape picture and our list of pros and cons. If you are willing, we would be interested in setting up a meeting to discuss this project and our vision, as well as answer any questions you may have. Thank you.

- Visual Sensory Group

Fiber Optic Wave Board

Advantages

- Passive calming effect through the color changing gradient, same effect as the bubble tube
- Simple to design and construct
- Colors can also be changed manually for "mood lighting"
- Can be any size depending on space availability
- Not too many electronics involved so easy maintenance and implementation into the room

Trade-Offs

- No interactivity whatsoever (may be a good thing depending on the kid)
- Fiber optics are extremely expensive
- Will be difficult to figure out how to work and program them

Hi Ethan,

I am happy to meet with you! What is your availability? Wednesday-Friday?

Ms. Brennan,

Would 1:30 on Thursday work for you?

S

Brennan, Stephanie

<sbrennan@staff.colonialsd.org>

to me ▾

yes this will work!

Visual Sensory Group Additional Questions

E

SIMERAL, ETHAN

to Stephanie, Michelle, Mary

Hi EES teachers,

This is the group working on the light stimulation device. We have some questions that we were hoping you could answer about specific parts of our project.

1. From a sensory standpoint, what purpose does light stimulation provide?
2. Are there any rules of thumb when it comes to visual sensory, such as rate of flashing, color selection, and interactivity in sensory spaces?
3. Do visual sensory needs vary between kids? If so, are there different needs and/or preferences?
4. Would you want to use lights for sensory activities alone, or would you want to use light for other purposes in this space?

Thanks so much for your help!

Hi

Hope this helps!

It is estimated that **80-85% of our perception and learning are facilitated through our visual sense**. Vision is important for a lot of different skills including interacting with others, spotting danger or opportunities to play, eating, sleeping, finding things we need, reading, writing and playing sports.

In an academic setting, children with visual processing impairments have difficulty with handwriting, like **pacing and sizing of letters and shapes**. At home, you might notice your child having trouble locating items in their room or in the fridge. They may, at times, misidentifying colors or shapes.

Toys that require hand-eye coordination, such as building sets or puzzles, **enhance children's ability to coordinate their movements with what they see**. This skill is crucial for both physical and cognitive development.

Sensory toys **provide a fun source of vital enrichment for neurotypical kids, encouraging them to engage with their environment in new ways**. For neurodiverse kids with SPD, ADHD, or ASD, these toys can help regulate and integrate sensory inputs in crucial ways.

Most students interact with their environment and need processing time, so anything fast pace is not a good example. You can also observe and utilize the water and light flashing in the water tube as a measure or baseline.

Needs vary but the basic premise of the need is present.

to Stephanie

Hi,

We appreciate the information you provided, and we were wondering if you could answer one quick follow up question in the context of your sensory space and your kids.

1. What are your kids' general interests when it comes to light/visual stimulation? What captivates them? Are there any specific interests that individual kids have?

Thanks so much!

Most of the students enjoy all colors and lights with varying speeds or just slow consistent patterns.

Interests in the rooms are slime/sesame street, transformers, and fonsi/elephants.

Keep me posted!
