

## Element C

The main requirements are that the AI reduces the workload of the medical work staff.

Overall workload by medical staff decreased by at least 20% in a time span of around 6 months.

This can be by working on more cases than staff can handle at once.

The AI should be able to give a read on images fed to it by doctors' scans or other medical imaging.

It should be consistent with its reading and doesn't change results without reasoning. When new conditions are added, it should be able to adapt or reason with the new results.

Design requirements would be likely to lead to a tangible solution, on a hit or miss scale (hit, miss, false alarm, or correct rejection).

All of the medical AI's we've listed have been approved by the FDA, meaning that they have been verified by stakeholders.
