

Element C:

1. Sun Protection

Sun protection is vital for plants because too much sunlight can cause damage, especially during hot weather. The tricky part is that the amount of sunlight can change daily depending on things like clouds, time of day, or the season. That's why it's important to regularly provide shade or other protective measures to help prevent stress on the plants.

2. Size

We need to make a platform that is 10x20 we want it to be this big so it can hold the average plant and maybe fit a few more of the plants on to the platform .

3. Support

Our platform needs to be able to support 10 pounds we need this much support so it can hold heavy plants or maybe more plants.

4. Durability

We need our platform to be durable because we do not need to be making too many platforms to add to pollution making it even harder to grow plants.

5. Programmable

We want our platform to be able to work when you aren't able to take care of it so it is more and more convenient.

6. Waterproof

We want the platform to be water resistant so the programming doesn't get messed up and it will make it more durable..

7. Decorated

We don't think that the appearance will matter as much as the other priorities because we really just want it to do good.
