

Element G: Construction of a Testable Prototype

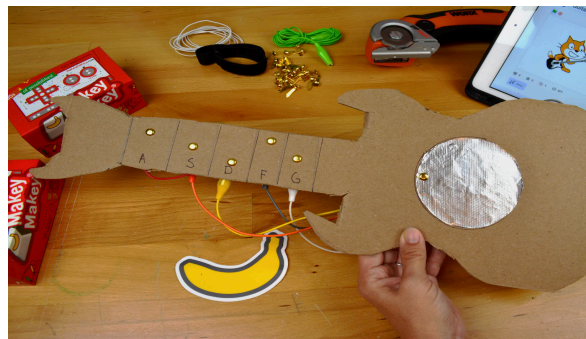

For the construction of a testable prototype using the Makey Makey STEM Kit, it is essential to focus on creating a functional model that can be evaluated for performance and usability. The prototype should incorporate all the necessary components, such as the Makey Makey board, conductive materials like aluminum foil or conductive tape, and any additional elements that enhance the user experience, such as a sturdy base or engaging visuals. During the construction phase, attention should be paid to the layout and organization of the components to ensure that they are easily accessible and intuitive for users.

Final design sketches for our Makey Makey projects can be really helpful, but they're not always necessary. With the flexibility of the Makey Makey kit, we can often just use the materials we have around us to create our designs on the fly. For example, when we made our piano out of fruits and cardboard, we could quickly set things up without needing detailed sketches. This hands-on approach allows for more creativity and experimentation, as we can adjust our designs as we go along. However, having some basic sketches can still be useful for visualizing how everything will come together and ensuring that we have a plan. Ultimately, the beauty of using Makey Makey is that it encourages us to think outside the box and be resourceful, making the design process both fun and spontaneous!
