

Element G

	Details	Tools/ Methods
Step 1	We built our platform which is found on the bottom of our platform and our main priority for the platform was to make sure it was stable. It has a very thin board on the bottom made out of a type of wood that just serves as resting area for the rest of the platform.	We used a drill and nails to drill the wooden platforms that hold the shade down and the wooden blocks that hold the circular part of our platforms.
Step 2	We started making a small platform for our circular turntable that spins in circles.	We used two wooden blocks and drilled them to the button platform and then drilled the same thin wood just laying on top of the blocks and we cut out a small hole in the middle with a small chainsaw so we can put the small engine in the hole that moves the circular board.
Step 3	We made the circular board that rotates with the plant on top so it can move to get the right amount of shade.	We used a small chainsaw to cut a thick piece of wood and measured a circle with very precise measurements. After that we hot glued some turf to lay on top of the cut out. We also cut out a small circle for the engine to be put in that will also go through the

		circle on the bottom platform so we can take the cutout on and off.
--	--	---

Step 4	We then figured out how we were going to set the batteries up and the engine so we moved around all the wires until we got the platform to rotate when we wanted to and we velcroed the timer to the side of the whole platform.	We used a small deer feeder timer that connected to the engine which was connected to the batteries all through red and black wires that have all the electricity running through them all to rotate the circular cut out.
--------	--	--

Step 5	We then found out that we needed two batteries to have enough power to turn the platform and we made a small piece of wood that went out on the side of the whole platform that we sat two of the batteries on to keep them all neat.	We used two small pieces of wood and we used drills and nails to nail it to the side of the platform and we made sure none of the wires would get in the way.
--------	---	---

Step 6	We then placed all of the wires and taped the ends of the wires to keep them from getting tangled and then we taped the wires to the bottom of the platform so they are stationary.	We used just electrical tape to tape all the wires to the platform.
--------	---	---

Step 7	The last thing we did was make our shade and we used a very thin	We used some felt and just placed it over top of the rolling pins and zip

	black felt and cut out a small triangle which is our sunlight portion and we ziptied the corners of it to the rolling pins that are nailed to the bottom of the platform to hold the shade up. We then just placed our small plant which was a fake plant from Lowes on top of the circular platform.	tied the corners around the top of them and we used scissors to cut out the triangle on the shade.
