

Details Tools and Manufacturing Methods used

Step 1: We discussed each other's ideas and came up with a plan to combine everyone's ideas into one

Step 2: We gathered all of the necessary resources that we needed or were available at the time. We got polyester, the necessary wood and a motor.

Step 3: We constructed the physical part of our design. We put our wood together and had our main base of the design complete. We had the four pillars and a base.

Step 4: We cut out a hole for the motor to go in as well as for all of the four rollers. We put the polyester on the rollers which would be used to cover the plant and provide them with coverage.

Step 5: We began to code the wires and put the motors into our design to make it correctly.

Unfortunately, our motor wasn't powerful enough to move all of the rollers without burning up the motor. We tried to do things like put sandpaper on the rollers to ease up the tension but it wasn't enough.

Step 6: We did our test attempts. We tried to ease the motor to provide less friction but still it wasn't enough.

Step 7: We made the slideshow and presentation for the design and brought it to the design-a-thon.
