

Element I: Presentation of Designer's Recommendations

The thing that we had never considered about this project until we were in its final stages was how impactful it was going to be. What started as a simple Makey Makey kit turned into a heartfelt tribute to our school. If you didn't know, I'm a high school junior, and I still have another year before I graduate. The more I worked on this project, the more I saw it as a love letter to our school. This was truly my way of giving back, and we accomplished that by creating something that would go on to teach the next generation of students who would follow similar paths to our own. I would even say that it's the love we had for this project that contributed to its success in the first place.

Let's say you've read this whole thing, and now you want to create a project like this on your own. My biggest piece of advice is that you need to love what you're doing. After all, it was our passion for this project that I believe led us to be so productive in the end.

I know, I know, you're looking for some design advice, and I'll give it to you straight. This applies to anything you want to achieve in your life. Please use your time wisely. Schedule, plan, then schedule and plan again. You must keep your project on track and on time; otherwise, you might not finish before a deadline.

It is also essential that you conduct thorough research. One of the greatest parts of our project, the interactive elements we created, came from extensive research into various educational resources and tutorials on using Makey Makey kits. A lot of times, you just want to jump in headfirst, and believe me, I can get like that, too. However, it is necessary to build a foundation of what works and what doesn't. There's no need to reinvent the wheel.

Not to mention, if you think your 3D components are sturdy enough, they probably aren't. This is exactly what happened to us, and it's always something to be aware of. Even though our initial prototype was fairly durable, we decided to reinforce our components just to be on the absolute safe side of the project.

If you're looking to replicate this project or even do something completely new, you must sit down and plan from start to finish. If you wing it, you might end up all tied up.

Thank you for reading this portfolio and for all of your feedback!
