Element L Initial Template

Element L: Presentation of Designer's Recommendations

Content of Recommendations (L1, L2)

Earlier on (in K3, if you completed it) you provided general lessons learned related to engineering design, and now (in L2) you are asked to provide recommendations for continuing work on this project in particular.

Answer as many of these questions as you can with specific recommendations based on your testing data, expert/stakeholder feedback, and any new research you've gathered. These recommendations may include process improvements (how you worked) and/or project improvements (actual design specific decisions you made). Provide recommendations to someone doing a similar project that might build or continue upon your work. For example: "Taking into account <something we did>, we believe doing _____ would improve _____ because _____."

- What could be done next to go further?
 - To go further we would need to equip a camera and depth tracker and prepare our ROV to go deeper into the ocean. We would have to make a better collection system so that we can take multiple samples quickly without having to struggle to switch up our collection system. The collection system would have also had to be more than single use.
 - Get a waterproof camera and depth tracker
 - We need an attachment system for the camera and the depth tracker so it doesn't break off
 - We would want an actual professionally made microplastic net and collection system
- What would you keep if you did the project again?
 - I would keep our frame and wiring, it worked very well. It held together throughout the testing, and we never had any water leakage or short circuits.
- What would you change?

Name: _____

Date: _____

Class: _____

- I would change our collection system fully, using a spare soda can is not an amazing solution. I would want something a little more professional for the sake of consistent data. I think that out of the entire ROV that was the part that we struggled with the most, and was the most annoying to deal with.
 - We would want an actual professionally made microplastic net and collection system
- What would have made this project easier for you to complete?
 - Having more time to try out different prototypes through testing, like multiple trips to the JCC or Fort Mason. If we had that I would have been able to try out various of our ideas instead of the one that we thought was the best. Without the chance to try something else out we might have missed out on a better option.
 - Starting the project earlier in the year would give us more time

In order to earn 5's on Element L, you will need specific and detailed ways the project can be improved and a rationale for why they are needed.

Detailed Plans for Implementation of Improvements (L2)

Now that you have generated a list of specific recommendations with their rationale, go back under each and generate a consistently detailed list about HOW these details will be implemented. Refer back to Element I where you concluded with some of these ideas.
