

Element L: Presentation of Designer's Recommendations

Even though our project was a success, we faced a few setbacks that we have learned from and will be putting to use if we ever make an attempt at improving our design. The biggest thing that we learned was to try cutting the wood before we glue it together instead of gluing it first like we did in our prototype. Gluing it together first made it more difficult for us when cutting it and set us back about a week in our building, so it'll be more efficient to cut the wood first. Besides that, our design was successful and does not need much change. In order to take our design further, there are a few adjustments that we could make. The first, a recommendation from our reviewers, would be by adding a material like cork or felt to the bottom of the bookend to increase friction and prevent slippage under the weight of heavy books. Secondly, we could experiment with making them bigger so that they can support more weight.
