

Element L: Presentation of Designer's Recommendations

Project Title: MJ's LAST Stand (Echo Rack)

#1

Planning Next Steps

What could you do next to make your project even better? Think about what else you could add or change to make it more interesting. For example, "What else could you do to make your project even cooler? What would make it more fun or useful?"

Realistically, there isn't really a lot that I would want to do to improve our project, in terms of features. The only other thing might be to add a gong mallet holder to the side of the wooden beams, but that can also just be done easily using 3D printing or another easy solution. We could have it so that the gong strikes itself, but that takes away a lot of the fun of hitting it.

Identifying Key Components to Keep

If you were to do this project again, what parts would you want to keep the same? Think about what worked well and what you liked about your project. For example, "If you did this project again, what things would you want to do the same way? What parts did you like the best?"

I liked a lot of our early progress the best, mostly because it was very noticeable, so that's something I probably wouldn't change. I like the design of the gong stand (without the mute), and this was partially because if Mr. Waller hated the mute, it would be easy to take off. For the most part, I felt like we had pretty good teamwork so I'd like to keep the same group members as well.

Planning Changes for Improvement

What would you change if you did the project again? Think about what didn't work as well or what you could do differently next time. For example, "What would you do differently if you did this project again? What things didn't work as well as you hoped?"

Looking back, I kind of wish we didn't have the gong mute. Despite that being one of the selling points of the design, it's a lot more effort for something that we aren't even sure if it's going to work. I also think that we should have done a little more journaling in addition to our project. We were too focused on time so we used all of what we had in class on the physical project, but not any of the journaling. I also think it would have been easier to (no offence to you Mr. Paz), do the majority of the project at home. The problem with working at school is that you have a bunch of small sessions instead of just one big work session. A week of 45 minutes of working is equivalent to 4 and a

quarter hours, and I think that we were thinking we had more time than we actually had.

Planning Next Steps

What could you do next to make your project even better? Think about what else you could add or change to make it more interesting. For example, "What else could you do to make your project even cooler? What would make it more fun or useful?"

I would like to make the bottom half of the gong stand more rigid. It's not necessary, but it does make me cringe when I see wood twisting or a bit out of place. I would also want to get rid of the sticky surface on the stand left from staining. Yet again, not necessary, but would be nice.

Identifying Key Components to Keep

If you were to do this project again, what parts would you want to keep the same? Think about what worked well and what you liked about your project. For example, "If you did this project again, what things would you want to do the same way? What parts did you like the best?"

The design of the upper half of the stand is really good and should remain the same if we did this project again. I would also keep the wheels because they work really well. I would want to keep the color of the stand the same too.

Planning Changes for Improvement

What would you change if you did the project again? Think about what didn't work as well or what you could do differently next time. For example, "What would you do differently if you did this project again? What things didn't work as well as you hoped?"

Something I would want to see replaced or redesigned is the mute mechanism, because while it is functional, it isn't all that pretty or efficient. The foot pedal is probably the part that requires the most improvement.
