

Reflection - Element L

- What could be done next to go further with this project?

Each team member could have more research projects done under their portfolio.
Concrete physics understanding(i.e, Newton's Laws)

- What would you keep if you did the project again?

- Taking into account that our detection system was able to effectively detect a fire in under 30 seconds and was created in a way that ensured no false alarms, we would keep our Detection and notification system if we had to do this project again.

- What would you change in your current prototype or testing plan?

Instead of just testing each system individually. We should have tested each system on its own and recorded that data. With enough information to know the limits of each system, to better understand how they'd work in a closed environment. Then test the integrated system to understand its limitations in case it needs remodeling.

- What would have made this project easier for you to complete?

- If we had access to more materials, I believe we could create a Fire protection system that would be able to prevent a fire even before it starts, or at least prevent its spread.
- If we also had more time, we would be able to refine our system more. And more research could have been done to ensure that the materials we used were truly the best for our model home.
