Planning Next Steps

What could you do next to make your project even better? Think about what else you could add or change to make it more interesting. For example, "What else could you do to make your project even cooler? What would make it more fun or useful?"

I think next time to make our project even better we could add more designs to it. I like the flowers, but I think we could also have some butterflies or other details that would make the resin desk pop. I also think that we could add wheels to the legs. For example our stakeholder wants to move their desk to another location in their house, having wheels would make the process easier and quicker.

Identifying Key Components to Keep

If you were to do this project again, what parts would you want to keep the same? Think about what worked well and what you liked about your project. For example, "If you did this project again, what things would you want to do the same way? What parts did you like the best?"

If I were to do this project again something that I would keep the same is the wood we use. I think the walnut wood looks very well for a resin desk. Another thing that I would keep about our project is the montier desk. Not only is it useful to place monitors, but I think that decorations can be added to make the desk look filled. I'd also like to keep the same teammates I worked with. I think that we all work really well together and that with our different strengths we can complete our project together.

Planning Changes for Improvement

What would you change if you did the project again? Think about what didn't work as well or what you could do differently next time. For example, "What would you do differently if you did this project again? What things didn't work as well as you hoped?"

Something that I would change if I did this project again is how I would approach this project. I think for me we weren't really prepared to start working on our desk. We mostly did our EDJs, but didn't really plan too far ahead. Another thing that I would change is how long we worked on our project. As I said we didn't think too

far ahead, but if we did I think we could have our project done sooner. There are other variables like Mr. R.N's knee surgery. He was our supplier of wood so we had to wait for him to return to school to start working on our project.

Planning Next Steps

What could you do next to make your project even better? Think about what else you could add or change to make it more interesting. For example, "What else could you do to make your project even cooler? What would make it more fun or useful?"

We could make ourselves more organized with what we plan to do. Also be a little more committed and involved in the processes we need to be involved in. The design could be changed depending on a person's preferences. We could also change the materials of things such as the wood, or change the functionality of the desk.

Identifying Key Components to Keep

If you were to do this project again, what parts would you want to keep the same? Think about what worked well and what you liked about your project. For example, "If you did this project again, what things would you want to do the same way? What parts did you like the best?"

I would keep our mentors as the same people. They have been extremely helpful and have contributed a lot of time and effort into the project as the whole. My group members are also components in this project I would keep the same because of their ethics and hard work. The design also seemed easy enough to keep the same as well. Everything else has the possibility to be changed in some kind of way, so it is best to be open for the outcomes of changes.

Planning Changes for Improvement

What would you change if you did the project again? Think about what didn't work as well or what you could do differently next time. For example, "What would you do differently if you did this project again? What things didn't work as well as you hoped?"

The design, the way we manage ourselves, and how efficiently we plan out our next steps and moves are all things we would truly improve upon. We were a little disorganized with our progress, and a lot of unpredictable situations did occur that messed with our timeline and progress. We would also be more timely with our steps, making sure to have deadlines on when something should be done by. Communication with our mentors could also be more consistent, which would be a greater advantage for us to truly get a product we want.

Planning Next Steps

What could you do next to make your project even better? Think about what else you could add or change to make it more interesting. For example, "What else could you do to make your project even cooler? What would make it more fun or useful?"

I think that adjusting the contents and design of the resin river would make this project and future projects better. The resin river has a lot of potential and is a great way for stakeholders to express their interests, decorate their work area, and to just be aesthetically pleasing. The resin river is extremely customizable since you can change the colors of the resin itself, the items and objects embedded in the resin, the patterns and textures present in the resin, and so much more. Personally, I enjoyed creating the resin river and how the product turned out.

Identifying Key Components to Keep

If you were to do this project again, what parts would you want to keep the same? Think about what worked well and what you liked about your project. For example, "If you did this project again, what things would you want to do the same way? What parts did you like the best?"

One part of the project that I would keep is the monitor shelf. I think it's very useful since it's separate from the main surface area of the desk. It's a small, designated area to store items of sentimental value or to place important items at an easy to reach location. One adjustment I would make is to create a backing underneath the monitor shelf and a small hole underneath it as well. For

me, it would be helpful since it would prevent any small items from falling out and the small hole allows for any wires to be plugged in easier:

Planning Changes for Improvement

What would you change if you did the project again? Think about what didn't work as well or what you could do differently next time. For example, "What would you do differently if you did this project again? What things didn't work as well as you hoped?"

One thing I would change if I did this project again was the planning and communication with mentors about materials for the project. While we were able to get all the necessary materials for our project, we got them at a later time, which pushed back the project in addition to Mr. R.N already being absent for an extended period of time. It was difficult because we weren't sure of the type of the materials we wanted or the price. We had to discuss our budget afterwards and while we as a group were able to come up with a payment solution, it was still an issue since we are the ones paying for it:

Planning Next Steps

What could you do next to make your project even better? Think about what else you could add or change to make it more interesting. For example, "What else could you do to make your project even cooler? What would make it more fun or useful?"

Something that I could do next to make our project even better is change the features and design of the resin art/waterfall design. When it comes to resin art you have a lot of space to do what you want where you can change the colors of the resin you want to use, the inclusions you add to the design you don't need to do a waterfall design, because there are other styles being able to use. Overall, allowing you to change the texture of what's in the resin, the style, and all these other options you can change and customize allows for your prototype to be way more aesthetically

pleasing. The resin art was also my favorite part of this building process because it was so fun to experience and learn how to do a waterfall resin design art for the first time and I loved how pretty it turned out.

Identifying Key Components to Keep

If you were to do this project again, what parts would you want to keep the same? Think about what worked well and what you liked about your project. For example, "If you did this project again, what things would you want to do the same way? What parts did you like the best?"

If I were to do the project again the parts I would keep are the same resin waterfall art design that was implemented into the desk. I think it's a really nice touch for the desk and I also believe that it helps motivate someone and improve their ergonomics to be productive. I would also really like to keep the pull-out drawers which are especially useful for a desk because you are able to keep anything you want in these drawers hidden from the public. Overall, they are a good use for people who work in business just like our stakeholder Ms. Vasque to organize and put files and documents in those pull-out drawers without having them all over the place on their workspace desk. The part I liked the best was of course the resin waterfall design. I'm in love with how it turned out and overall it's such a great and unique feature to have in your furniture pieces.

Planning Changes for Improvement

What would you change if you did the project again? Think about what didn't work as well or what you could do differently next time. For example, "What would you do differently if you did this project again? What things didn't work as well as you hoped?"

What I would change if I were to go through the project again is that I would want my team to be more organized and have better planning and good schedules when it came to the gathering of materials and the days that would be the building process for the desk. The time/section we were supposed to build our desk didn't go as well due to that we didn't have the materials we need and Mr. R.N. was absent for an extended period of time due to a medical reason, which caused us not being able to do our project or starting building our final design of the desk due to that we did not have the wood, which he was providing, and the workplace to do the resin. In the end we were able to start our building process of the final prototype of our desk, but we weren't able to finish it in time it was due. However, we are making good progress with the desk. Furthermore, the schedule and planning was not very organized and we had some hiccups when it came to actually building the desk, so if we were to do it again our group would be more organized and have better scheduling and planning in order to ensure that we can build earlier. Something else that didn't go well was one of

the sides of the waterfall legs. Mr.R.N during the construction club with some people did the side of the waterfall where they did the resin and included the flowers. However, the flower inclusions were not located that very and did not look aesthetic pleasing as the ones we did for the main table top. Our group is not mad about it because it doesn't look bad, but we just wish we could have done it how we want it. But, we also understand and appreciate the hard work from Construction Club members and Mr.R.N for taking their own time to do the project. Overall, next time as stated above, have better scheduling to be a part of every step in the building process to ensure that our desk final prototype is matching the result and priorities of our stakeholder, Ms.A.V . These are some things I would change if we were to do the project again.
