

Element L

In this project you will go through many ups and downs and the downs are very unexpected because with the blink of an eye your project could have a malfunction and you sometimes might have to start from scratch. You will need to be very careful with every move you make to ensure that there is no delay in project completion. We learned that working together can prevent arguing because most of the wasted time is put into brainstorming the best possible idea and arguing will make it a slower process.

What could be done next to go farther? There are many things we can do to go even farther than we have in this project. First, we could make a funnel system for water so that the plant is watered properly. Second, we could make the support of the platform more durable and get a more durable shade. Third and finally, we could make the actual size of the project bigger so that we could fit more plants on the platform.

What would you keep if you did this project again? There are even things we would definitely keep if we do this project again. One thing we would for sure keep would be the main concept of this whole design which was having a rotating platform instead of something else around the plant moving. Another thing we would keep would be the shade above our project because it is the right amount of shade the type of plant needs. One last thing we would keep would be having a

timer so that the plant will have a certain amount of time to be rotating which would also help us with managing it.

What would you change?

I would change the material we used. If we used a better material we could have made the platform more durable and consistent. We could also change the size of the project to make it available for the use of other plants. This way you could allow the sun to hit multiple plants at once while the other plants are in the shade. The final thing I would change is how waterproof our design is. The platform is very waterproof and could break easily. We could put a box around the batteries to make sure they don't get wet when it rains.

What would have made this project easier for you to complete? There are lots of things we could have done to make this project a little easier to complete. One thing would be building a better/stable bottom for our platform. This would have helped support all the heavy weight on top of it and could have let us focus more on moving parts. Another thing would be having a better circular board that wasn't as heavy which would have helped with getting it to move and the more batteries that were needed. One last thing we could have done would be switching out the part from the microwave for something more stable and could function more better which would have helped with getting the board to spin more easier.
