

Element L

If we continued our project, recommendations would include expanding the abilities of the LED lights. We could go back to our function of design charts and create more games or features to make our design more unique. It would have been easier to complete this project if we had the ability to communicate with our stakeholders more often. Also, if we would have been able to go into the classroom more often as well, it could have sped up the design process. We would recommend deeper research on how certain types of LED light strips can be programmed. Although we have the ability to change some settings on the LED lights, it would be more engaging if they could be used for more creative activities. We received feedback on researching adjusting brightness on LED lights and although we did, if we had more time we could do deeper research and more testing on that specific topic. We could have made improvements on our work ethic because there was a lot of procrastination and distractions and due to that we couldn't have a more detailed design. Taking into account distractions and time limitations, we believe creating a more strict plan of action would improve our productivity because it would motivate us to complete certain tasks in the time permitted. Also, a more thorough plan would allow us to have premade a schedule that would make the LED lights finished in the time limitations. Having measurable goals each week would have made us move faster and overall be more prepared and organized. Specific improvements to the design based on testing results could include making it more safe by covering the outlets so the kids wouldn't have access to them. Also regarding safety, we could better fasten any extra LED strip to the wall to prevent any hazards of the lights being pulled down. We also decided to make the design more user friendly by creating a job aid to help the teachers. However, if given more time we could have added more functions into this so the teachers would have known how to do more things with the lights. We came across these improvements mainly through talking with the class moderator and observing the class as a whole. Speaking with Mrs. Brennan, it was noted that manuals

Our plan to implement these improvements would begin with us visiting the classroom as a "check-up" to see how the lights are holding up. If we notice any loose areas or weak points then we'll use the same tape or even hooks to fasten those points down. Apart from this, other issues may be brought to our attention through these visits and even classroom aids' feedback. Thankfully, given enough time, we'll get quality feedback that helps us focus on specific improvements.
