

Element L: Presentation of Designer's Recommendations

To make our school rain garden better, I think we should add more native plants like purple coneflowers and switchgrass because they have deep roots that help soak up more water and stop the soil from washing away. We should also put up signs that explain what the garden does and why it's important, so students can learn from it. First, we'll check out the space and make a plan. Then we'll work with local plant shops to get the right plants. In a few weeks, students and teachers can help with the planting and putting up signs. We'll also create a schedule to take care of the garden so it keeps working well.
